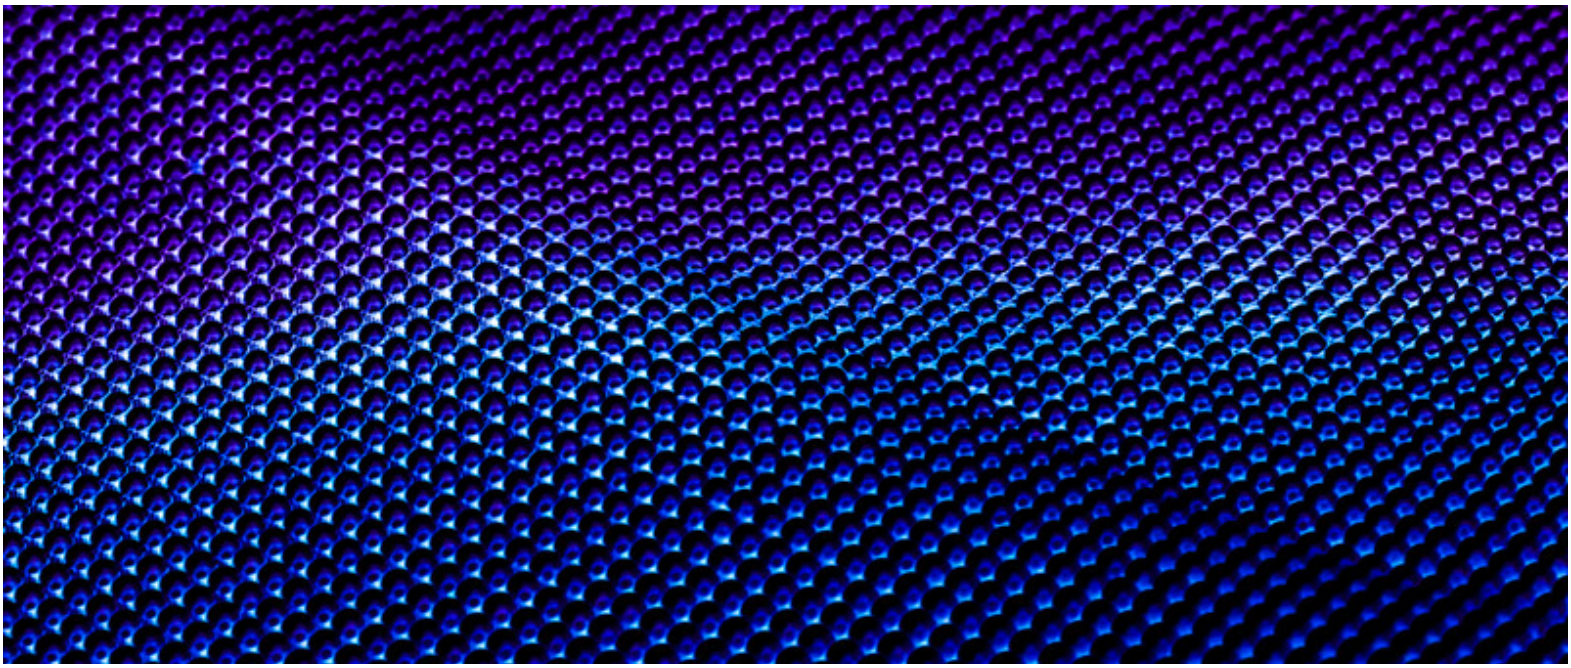
PHANTOM NETWORK

HOW PHANTOM WILL SOON
PROTECT EVERYTHING PAGE 1



Phantom Network

Phantom network will be a huge project that we have and will be working on for the next few months, alongside with the next bot. This could take months and we aren't sure just yet how to release it to the public, but when we can we 100% will. Nothing has gotten in our way and we haven't run in to any problems except for what we should use to host the next website! We will also be launching a twitter account possibly within the next few days, however at the moment the only way to contact us is through our email.

10 ways to stay PROTECTED

On the internet, there are a lot of things that could go wrong, viruses being created by the second, scams, and fraud occurring so fast you won't even realize it exists, so we are here to help with that.

1. Get the latest anti-virus and firewall software
Download updates regularly to make sure you're protected against any new online threats.

2. Update your internet browser
The latest versions have built-in protection against fake websites and viruses.

3. Create a strong and easy-to-remember password
Passwords that combine letters and numbers are generally harder to guess.

4. Use a different password to the one you use for other services
You should have a unique password for every software.

5. Change your password on a regular basis
It's a good idea to change your password every month.

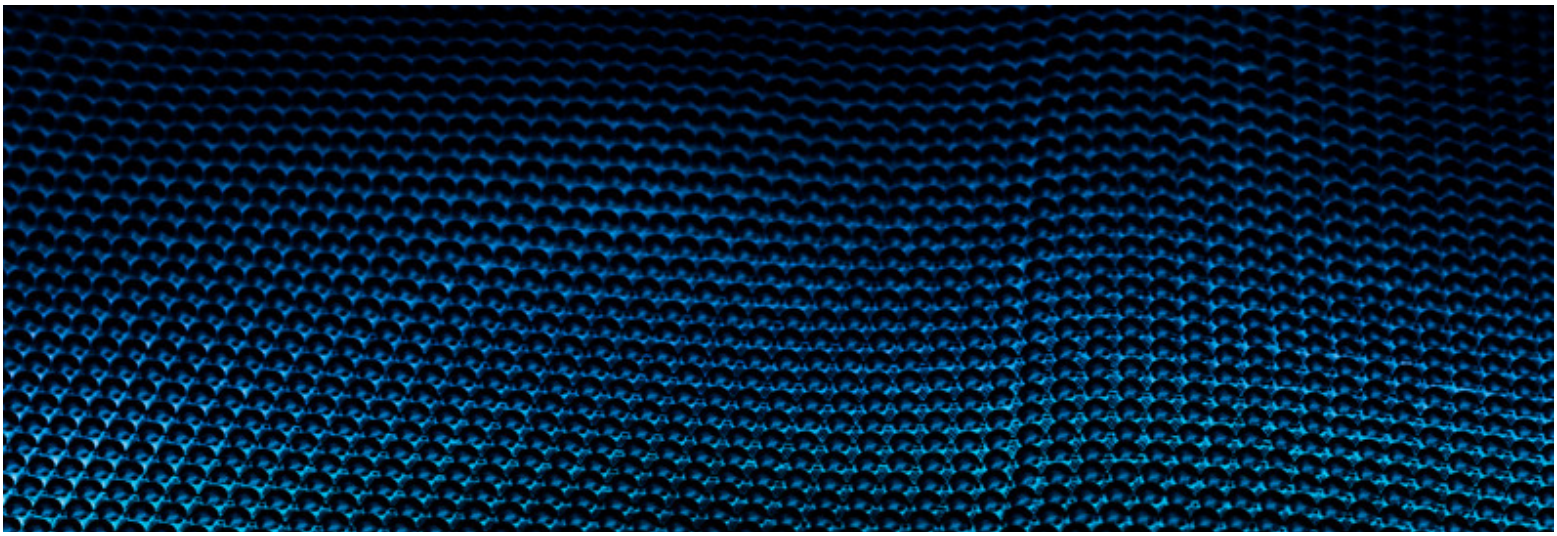
6. Never share your password
No developers will ever ask you for your password. If you receive a call or email from someone claiming to be from a developer, ignore it and contact the brand impersonated immediately.

7. Don't let your browser remember your log on details
It's much safer to re-enter your details every time you log on, even if it takes slightly longer.

8. Never visit suspicious websites
These can sometimes be scams or download viruses to your computer.

9. Learn to spot fake emails and websites
Criminals use them to con people into giving away passwords and bank details – the technical word is 'phishing'.

10. Avoid online fraud and con tricks
To protect yourself and your money on the internet, look out for deals that look too good to be true.



What Do you want to do with phantom in the future?

I want to use Phantom to the full extent of making sure that Discord is a safe place for everyone, if we fail to create the rumored Phantom Network, then we will stick to working on discord.

Why do you think people don't sign up for accounts?

Most people will think that a cybersecurity brand shouldn't be asking you to create an account with them, however, by doing this you are subscribed to receive emails from us therefore making sure you are always protected. We don't even ask you to make a password as all we can trust is that you will give us your email and we will verify that it is you attempting to make the directed change.

With your next bot, what are you planning to do with it?

The next bot we create will be designed to create a safe and secure chat to talk in within with friends, which will automatically delete itself after 30 minutes, and remove the message history with it. This could take some time to code but we also want to make a fun bot with a story to progress through for all people to try. However this is still in testing and might not be true for the next few months.

If you don't get enough people to sign up, what will happen?

Phantom as we know could die out, and then nobody would know what issues occur in discord, we would run the bot for as long as we can until we run low on funds to continue to run it. If the bot does not run whenever there is a problem, the message won't get out unless an employee announced it, which only happens on issues that are greater than anything we have ever seen.

Who else works with you?

Some of my friends help me do this without pay allowing us to have more funds to continue this service for free.
